

FRESH AIR DUCT INSTALLATION INSTRUCTIONS

(RIGHT SIDE)

FOR HENRY J MODELS 513 AND 514

PART NO. 100172

1. Remove the 4-1/4" diameter knockout plug from the fire wall. If heater is to be installed, remove the rectangular scored section of fire wall insulation and trim panel. If no heater is to be installed, cut a 4-1/4" diameter hole through insulation and trim panel.
2. Using template, lay out and drill four (4) 1/8" diameter holes for damper mounting screws.
3. Cement gasket on fresh air damper housing flange, being sure that holes in gasket align with holes in flange.
4. Install damper assembly on front of fire wall with damper lever in vertical position. Secure to fire wall with four (4) No. 8 self tapping screws.
5. Remove 4" diameter knockout plug from right panel of radiator shroud.
6. Assemble fresh air intake screen and flange on rear side of radiator shroud, securing in position with three (3) No. 14 self tapping screws running through shroud into flange.
7. Remove battery. Drill 7/32" diameter hole on engine side of battery support bracket flange 2" from rear of bracket on horizontal center line of flange.
8. Slip one end of fresh air intake tube over damper housing. Slip other end over fresh air intake tube flange on radiator shroud. Secure both ends with hose clamps.
9. Install air vent tube support clamp around vent tube in a position where it can be attached to battery bracket. Attach support clamp to battery bracket with bolt, lockwasher and nut. Head of bolt should be on battery side of clamp.
10. Remove button plug from right side of steering column bracket. Install control in bracket and secure with nut and lockwasher. Push control cable through choke cable grommet in fire wall. With handle on control pushed in and control damper in closed position, connect wire in control cable to lever on damper housing. Clamp free end of control cable housing to bracket on damper housing.
11. Reinstall battery.
